

Section	Purpose
Name	Periodic order issue
Description	A best price, fixed day order from the supplier the system issues in a fixed day
Actors	Suppliers, Suppliers Manager
Precondition	The supplier and product are already registered in the system, and a periodic order has been configured
Post-conditions	The supplier gets the order after creating a new periodic order
Basic course of action	1. Verify whether a new report exists for this order; if it doesn't, create the order using the information from the previous one. 2. The system selects the supplier that offers the lowest cost, based on the bill of quantities. 3. The supplier sets a fixed delivery day and calculates the total cost of the order.
Alternate courses	1. The product is not available 2. If multiple suppliers offer the same price, select one at random.

Pseudocode:

```

1. if newReport(OrderId):
    # throw exception "new report exists"
else:
    OrderDetails <- getPreviousOrder()
    PlaceOrder(OrderDetails) # place the order depending on the previous one

getSystemSuppliersDependingOnOrder(NewOrder)
List cheapestSupp <- getCheapestSupplier(SuppList, NewOrder)
if len cheapestList == 0:
    throw exception "No-supplier-found"
if len cheapestSupp == 1:
    Supplier newSupp <- cheapestSupp[0]
    MakeOrder(newSupp, newOrder)
// if there are more than one supplier choose one randomly and then do the same

```
